
Absolute daylength is split at 13.25 h, using the full primary sample (140 participants; 778 participant−days; 35,949 half−hours).
Within each panel and group, participants receive equal weight and their days receive equal weight.
Grey windows with dashed boundaries: before DLMO (−11.25 to −9.58 h) and after MSFsc (0.92 to 4.42 h). Striped band: DLMO reference.
Civil dawn−to−dusk uses solar altitude −6°. Counts include all days with solar metadata in each group, regardless of observed light at that phase.
