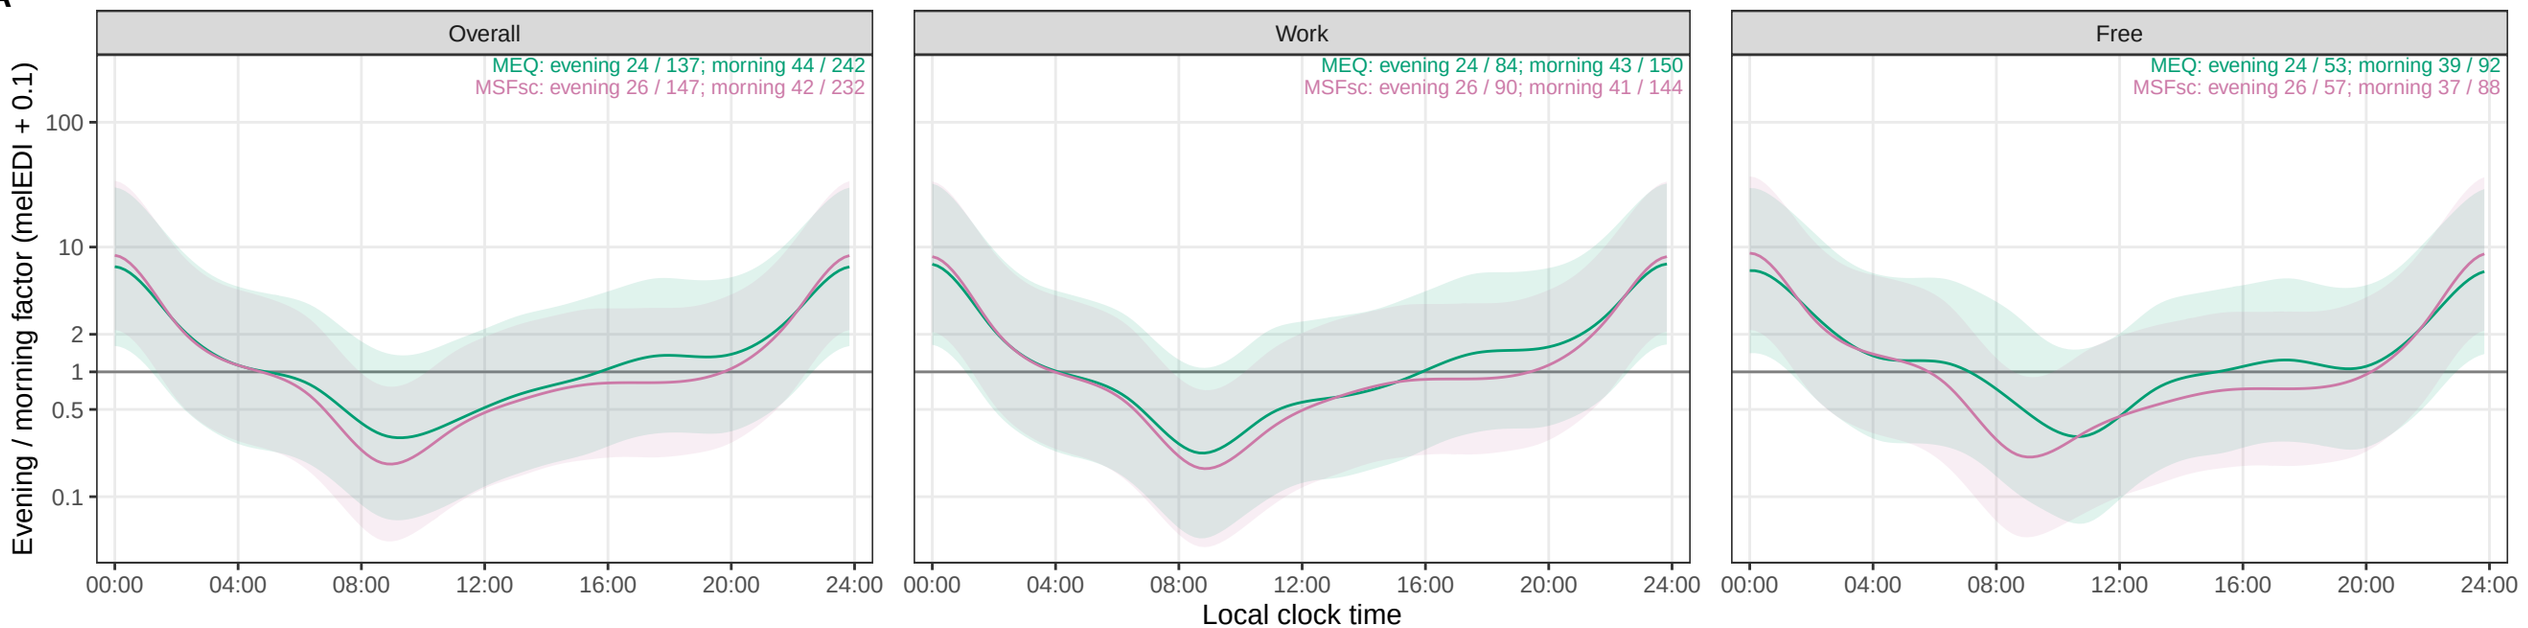
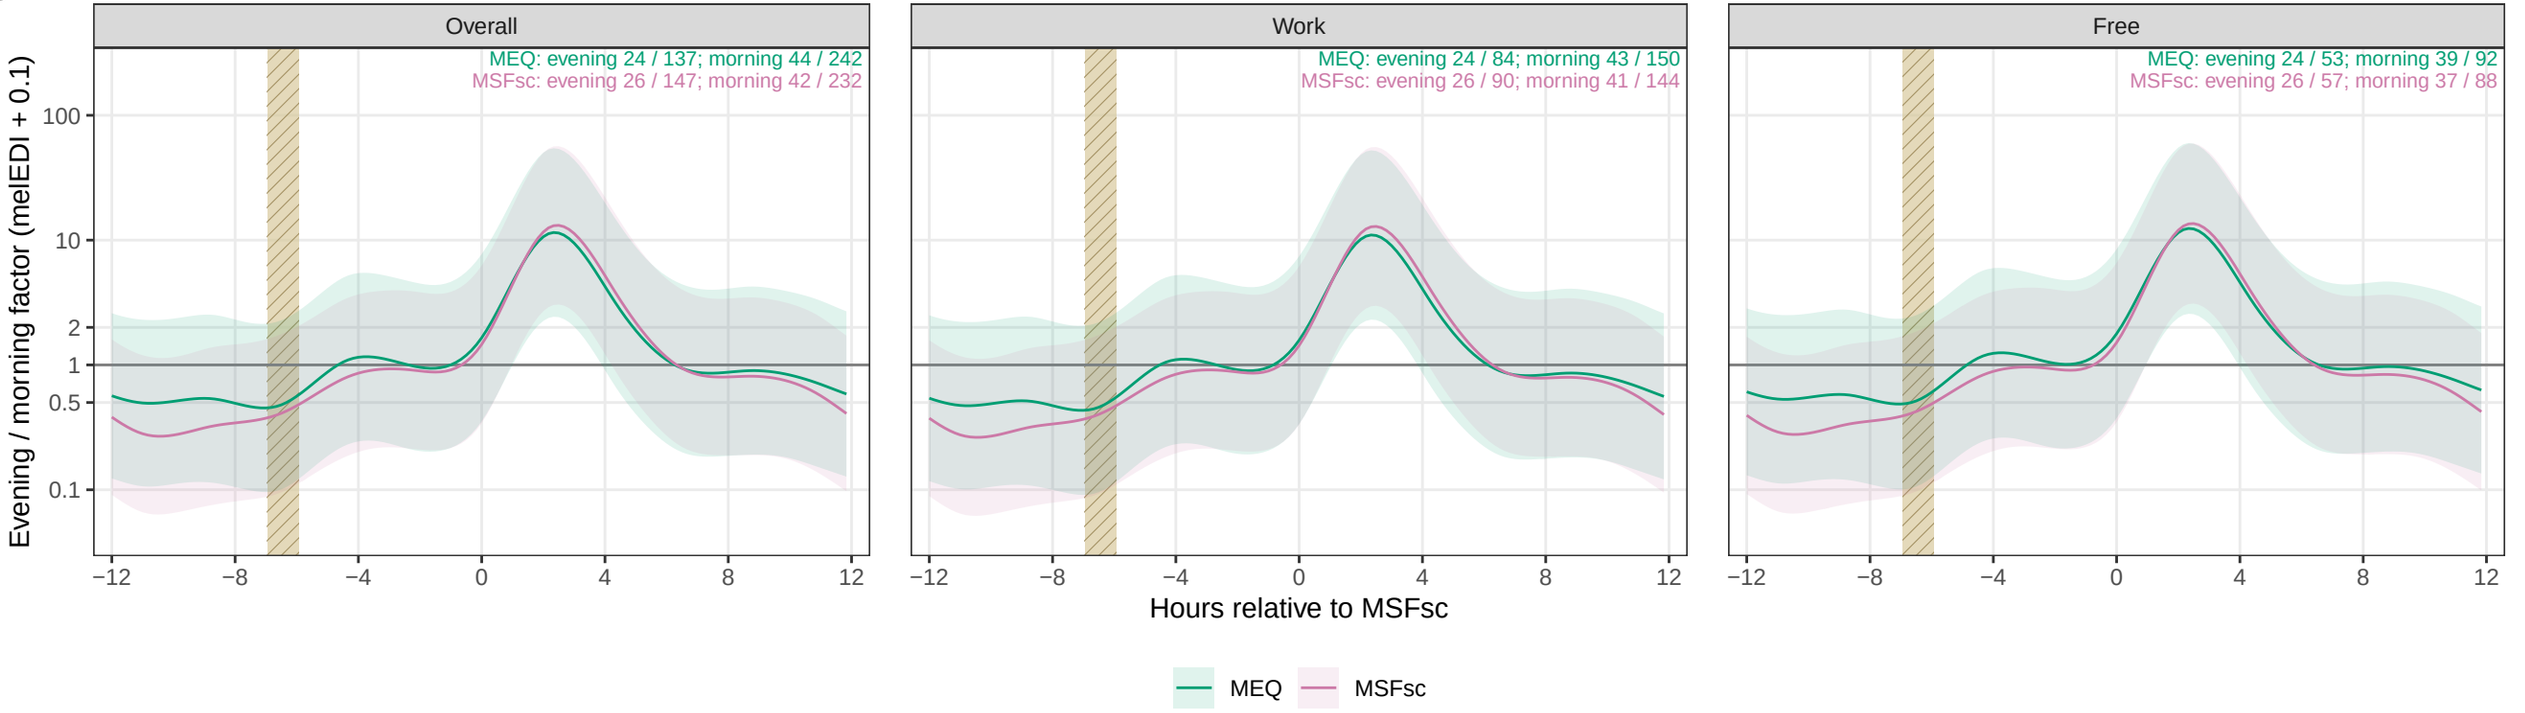
MEQ and MSFsc grouping on the same restricted sample

68 participants; 379 participant−days; 17,558 half−hours. Counts: participants / participant−days by chronotype direction.

A



B



A: clock time. B: circadian phase. Striped band: DLMO reference. MSFsc uses the original median; MEQ pools moderate and definite types.
Factors refer to melanopic EDI + 0.1. Bands cover all three day contexts and times at 95% within each coordinate and classification.
Descriptive sensitivity estimates under the Gaussian reference variance model; they do not test equivalence of the classifications.
