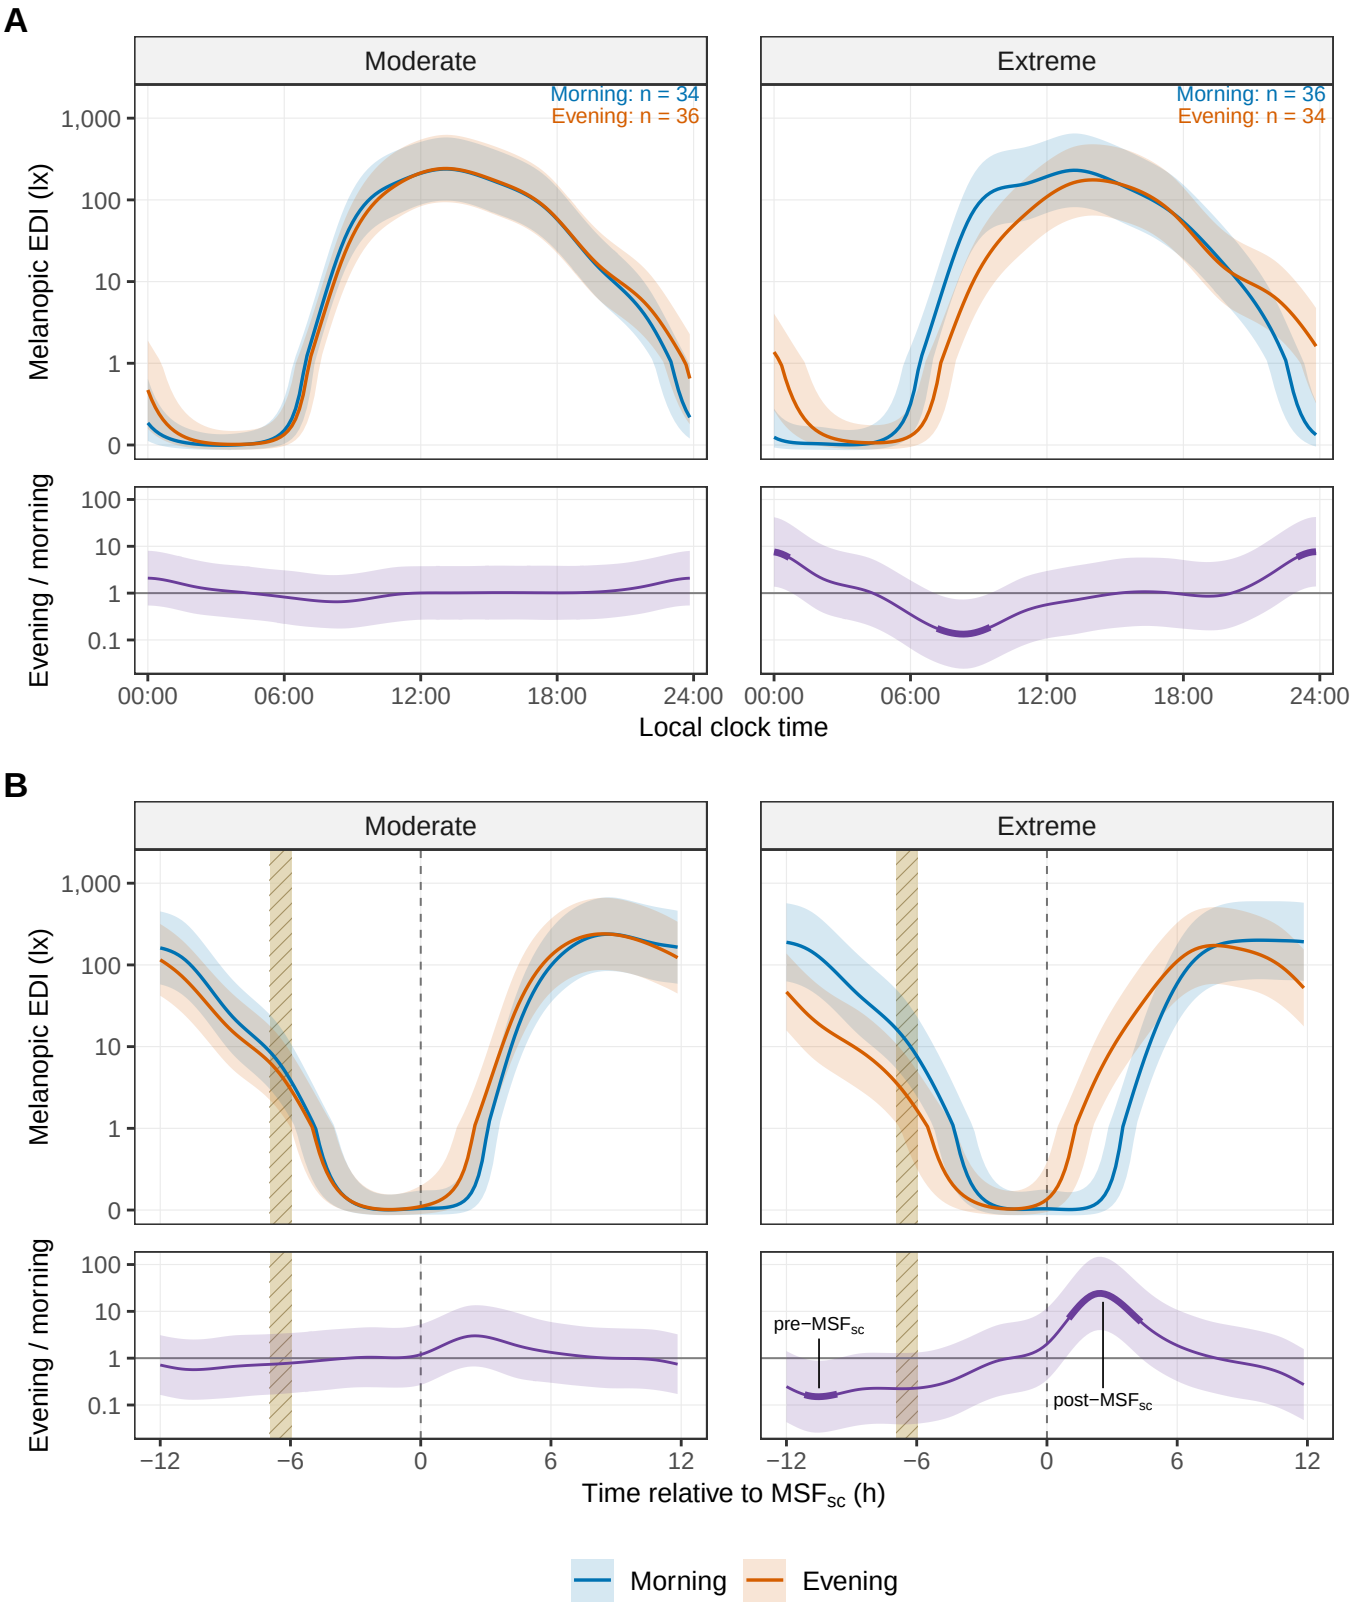
Chronotype differences persist after alignment to corrected midsleep



A: local clock time. B: time relative to MSFsc. Each block pairs exposure curves with shorter evening/morning contrast panels. Bands are 95% simultaneous within each coordinate: across the 12 group−by−day−context exposure curves above, and the 20 registered contrasts below. One denotes no group difference; bold lavender segments mark its supported exclusion. Black labels and vertical leaders identify the pre−MSFsc and post−MSFsc intervals. Dashed vertical lines mark MSFsc at zero. Ratios refer to melanopic EDI + 0.1. Stripes mark the published DLMO reference interval. Common photoperiod and work/free−day distributions; 140 participants and 778 days.
